

Product	Fibron® Horizon® Decking with PermaTech® Innovation
Report	Cutting and Drilling Tips for Installation of Fibron Horizon Decking
Procedures	Cutting: When cutting Fibron Horizon Decking, remember to use a carbide-tipped blade with a minimum of 24 teeth. A frayed edge may result from dull blades or blades fewer than 24 teeth. Cut edges showing a frayed edge cut can be quickly scraped away with a coarse sanding block (i.e. 40-60 grit), or a utility knife blade facing backwards and dragged across the area.  Drilling: Traditional twist drill bits are recommended for drilling holes through boards. Spade-style drill bits can cause damage to surface when drilling in hot weather.
Additional Product Information	• Ultra low maintenance with superior stain, fade and mold resistance • Patent pending PermaTech surface outperforms traditional composite decking • Reversible boards save on cut and waste • Board Size: 5.4 in. x .935 in. • Grooved decking available in 12, 16 & 20 ft. Square edge decking available in 20 ft.
